## How static files work in production (nginx version)

## How static files work in production (Apache version)

The user requests
http://yoursite.com/a\_page\_served\_by\_django/

The brower asks the web server.

Apache delivers Django's response to the browser.

In the response, Django renders href="1% static 'yourfile.css' %}" as href="1% static 'yourfile.css' %}" as href="1/your/static/url/yourfile.css". It does this because it's been told that sTATIC\_URL="/your/static/url/".
